

Tributary

The non-custodial capital automation layer for Solana

Raising \$250k Pre-Seed.

The Problem

Stablecoins are a **\$300B+** asset class.

Yet every financial action on-chain is **still manual**.

- Payments
- DCA
- Treasury management
- Yield allocation
- Agent spending

Every action requires a signature. Every signature requires a human.

On Solana, money has **no automation layer**.

Our Insight

Most companies automate money by **taking custody**.

We believe custody is the problem.

Instead of holding your funds, Tributary uses Solana-native delegation:

Approve once. Automate forever. Keep your keys.

The Product

Tributary is the automation layer on Solana.
Users define rules. The protocol executes them.

- Recurring payments
- DCA into assets
- Treasury rebalancing
- Yield deployment
- AI agent budgets

DeFiSaver for Solana — powered by a native automation primitive.

Why We Win

OTHERS OFFER

- Custodial automation
- Single-purpose schedulers
- Isolated DeFi products

WE PROVIDE

- Non-custodial execution
- Cross-protocol composability
- Developer platform + SDKs
- Full automation stack

We're building **infrastructure** for everyone, products for profit.

Traction with v0 for Payments only

Payments is live on Solana mainnet (subscriptions, milestones and pay-as-you-go)

4,000+

PAYMENTS EXECUTED

\$12k+

VOLUME PROCESSED

6+

INBOUND INTEGRATIONS

\$0

MARKETING SPEND

95%+

TEST COVERAGE

All before raising capital to build v1 with the composability branch.

Business Model

Protocol fee on automated transaction volume.

Every automated action becomes revenue.

- Payments
- DCA
- Treasury operations
- Yield routing
- Agent spending

We scale with transaction flow, not custody risk.

Why Now

The next wave of digital money is **capital automation**.

Every dollar moving on-chain will eventually need:

- Rules
- Policies
- Automation

Tributary becomes the **execution layer** underneath that activity.

Market Landscape

The market proved demand for financial automation. Solana is missing a non-custodial layer.

Company	Chain	What they automate
DeFi Saver	Ethereum/EVM	Leverage, liquidation protection, yield
Summer.fi	Ethereum/EVM	CDP, borrowing, leverage automation
Instadapp	Ethereum/EVM	Smart accounts, DeFi automation
Enzyme Finance	Ethereum/EVM	Portfolio & vault management

DeFi Saver and Summer.fi are the closest analogues. **No one operates on Solana.**

The Difference

Most competitors automate **actions**. Tributary automates **money**.

WHEN → PULL → ROUTE

enables:

- Pay a subscription
- DCA into an asset
- Stake idle capital
- Rebalance a treasury
- Fund an AI agent
- Route capital across protocols
- ...

Team

Fabian Schuh, Dr.-Ing

- web3 veteran with **10+ years** building in crypto
- BitShares, Steemit, MakerDAO, exbet.io, Mash.fun, repo.trade
- Successfully built products across all of web3
- **4 prior exits**
- Built the entire Tributary stack solo
- Live protocol **before** funding

Unique founder-market fit for this category.

The Vision

Today: Recurring and programmable payments

Tomorrow: Automated capital allocation

Long term: The operating system for on-chain money

Stablecoins made money internet-native.

Tributary makes it programmable.
